# Java Most Asked Stream API Coding Questions

# 1. Filter Even Numbers

**Problem:** Given a list of integers, return a list containing only even numbers.

**Solution:** 

**Explanation:** The filter method is used to apply a condition that keeps only even numbers. The collect method gathers the results into a new list.

## 2. Find Maximum

**Problem:** Find the maximum value in a list of integers.

**Solution:** 

**Explanation:** The max method takes a comparator and returns the maximum element wrapped in an Optional.

## 3. Sum of Elements

**Problem:** Calculate the sum of elements in a list of integers.

**Solution:** 

**Explanation:** mapToInt converts the stream to an IntStream, which provides the sum method to get the total.

# 4. List of Names to Uppercase

**Problem:** Convert all strings in a list to uppercase.

**Solution:** 

```
List<String> names = Arrays.asList("Alice", "Bob", "Charlie");
```

**Explanation:** The map function applies String::toUpperCase to each element, transforming them to uppercase.

# 5. Sort List

**Problem:** Sort a list of integers in ascending order.

**Solution:** 

**Explanation:** The sorted method sorts the elements of the stream in natural order.

#### 6. Count Elements

**Problem:** Count the number of elements in a list that are greater than 5.

**Solution:** 

**Explanation:** The filter method removes elements that don't satisfy the condition, and count returns the number of elements remaining.

#### 7. Get Distinct Elements

**Problem:** Get a list of distinct elements from a list of integers.

**Solution:** 

**Explanation:** The distinct method filters the stream to include only unique elements.

#### 8. Reduce to Sum

**Problem:** Reduce a list of integers to their sum.

**Solution:** 

**Explanation:** The reduce method takes an identity (0 in this case) and an accumulator function (Integer::sum) to calculate the total.

# 9. Find Any

**Problem:** Return any element from a list of integers.

**Solution:** 

```
Optional<Integer> anyElement = numbers.stream()
    .findAny();
```

**Explanation:** findAny potentially returns any element from the stream, wrapped in an Optional.

#### 10. List First Names

**Problem:** Extract first names from a list of full names.

**Solution:** 

**Explanation:** The map function splits each name string and selects the first part.

#### 11. All Match

**Problem:** Check if all numbers in a list are positive.

**Solution:** 

**Explanation:** allMatch returns true if every element in the stream matches the given predicate.

## 12. None Match

**Problem:** Check if there are no negative numbers in a list.

**Solution:** 

**Explanation:** noneMatch checks that no elements match the negative condition.

#### 13. Find First

**Problem:** Find the first element in a list of integers.

**Solution:** 

**Explanation:** findFirst returns the first element of the stream, wrapped in an Optional.

## 14. FlatMap for Nested Lists

**Problem:** Flatten a nested list structure.

**Solution:** 

**Explanation:** flatMap converts each element into its own stream and then merges them into a single stream.

# 15. Grouping Elements

**Problem:** Group users by age.

**Solution:** 

```
Map<Integer, List<User>> usersByAge = users.stream()
.collect(Collectors.groupingBy(User::getAge));
```

**Explanation:** The groupingBy collector groups elements based on the age property, creating a map where each key is an age and each value is a list of users with that age.

#### 16. Peek Elements

**Problem:** Print elements of a stream during processing without altering the stream.

**Solution:** 

**Explanation:** peek is used for debugging or performing actions without changing the stream. It prints each element before passing it along the stream.

#### 17. Limit Stream

**Problem:** Limit the output to the first 3 elements of the list.

**Solution:** 

**Explanation:** limit truncates the stream to be no longer than the specified size.

# 18. Skip Elements

**Problem:** Skip the first 2 elements of a list and return the rest.

**Solution:** 

**Explanation:** skip discards the first n elements of the stream.

## 19. Convert to Set

**Problem:** Convert a list of integers to a set to remove duplicates.

**Solution:** 

**Explanation:** Collecting the stream into a Set automatically removes duplicates.

## 20. Summarizing Statistics

**Problem:** Get summary statistics for a list of integers.

**Solution:** 

**Explanation:** summaryStatistics provides a summary (max, min, average, sum, count) for a stream of integers.
